USER AND PROBLEM

Jev decides. An LLM writes. A person sends.

Farz sorts the ZainCash support queue in batches and hands anything it is unsure about to a person.

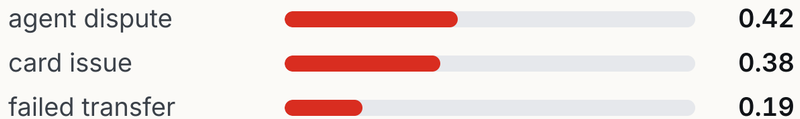

حولت 250 الف لاخوي من الصبح والفلوس انقصت من حسابي بس هو ما وصله شي

Transfers team

250,000 IQD pulled from the text, checked against the ledger, reply drafted for the agent.

الصراف بلع البطاقة ومنطاني فلوس بس المبلغ انخصم

Sent to a person

Jev is split between an agent and a card problem. Farz says so instead of guessing.

THE USER

A ZainCash support agent. One queue, three ways of writing: Iraqi dialect, English and Arabic in Latin letters.

THE PROBLEM

Every ticket is read by hand just to learn what it is and who owns it. Money problems wait in the same line as questions about fees.

WHAT CHANGES

Farz does the reading and sorting. The agent only approves, edits or takes over. No reply leaves without a person.

HOW IT WORKS

Every ticket takes the same five steps.

1
Batch in
Tickets from the app and support channels, grouped every few minutes.

2
Jev decides
Category, priority and team, each with a confidence.

3
Rules extract
Amount, phone and reference, only if they appear in the text.

4
Ledger checks
Do those values match a real transaction on the wallet?

5
LLM drafts
A reply in the customer's own dialect. It decides nothing.

Confidence gate

Decides where each ticket goes next.

Sure
To the right team's queue with the draft ready. The agent approves or edits it.

Not sure
To a person, with Jev's split shown so they see why.

Scam words
Always a person, marked urgent, whatever the confidence.

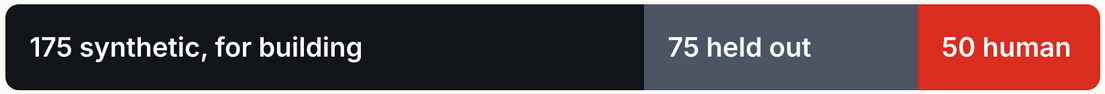

Jev never writes text, the LLM never routes, and a person sends every reply.

MODELS, TOOLS AND DATA

Small, cheap models.
Test data we can trust.

Decisions	Jev (TypeSafe AI). Returns a probability for every option, so we know when it is unsure.
Reply drafts	GPT-6 Astra, or a free model from the challenge's list. Swappable.
Extraction	Plain rules for amounts, phone numbers and references. No model can invent a number.
Ledger	SQLite with 40 mock wallets and their transactions.
Agent screen	Python backend, one web page: queue, draft, approve, edit, take over.

300 TICKETS

Synthetic: an LLM writes tickets per category in dialect, English and Arabizi, with typos and mixed scripts. We read every one and throw out the fake-sounding ones.
Held out: never looked at while building. Only used for the final score.
Human: 50 tickets written by real Iraqis about real wallet problems. Scored on their own, so clean synthetic text cannot flatter us.

9
categories

4
priority levels

3
ways of writing

TESTING AND METRICS

When it is sure, it is right.
When it is not, a person decides.

First test, 23 Sep 2026: 63 Iraqi-dialect tickets, most confident first, run once with no tuning

57 above 0.90 confidence. All 57 right.

6 sent to a person, including both mistakes.

WHAT WE MEASURE	FIRST TEST	MVP TARGET	WHY IT MATTERS
Category right, held-out set	**96.8%**	**90%+**	The first test was small and written by us
Right when routed without a person	**57 / 57**	**98%+**	A wrong team costs the customer a day
Scam tickets that reach a person	**n/a**	**100%**	Reported on its own, never averaged in
Is "90% sure" right 90% of the time?	**n/a**	**within 5 pts**	The gate only works if confidence is honest
Drafts rated send or light edit, of 50	**n/a**	**70%+**	Rated by a support agent, not by us
Time and cost per ticket	**463 ms**	**under 1 s**	$0.0023 for all 63 in the first test

RISKS AND PLAN

Five weeks to an agent clearing a real queue.

WHAT COULD GO WRONG

A scam routed as routine
Scam words always go to a person

Jev down on Iraqi internet
One retry, then the ticket goes to people

A draft with an invented amount
Drafts may only use values found in the ticket

Synthetic data too clean
Human tickets scored on their own

Customer data in a model call
Phone and card numbers masked before any call

WEEK BY WEEK

Week 1	300 tickets, 40-wallet ledger, held-out set locked away
Week 2	Batch intake, Jev routing, confidence gate, first held-out score
Week 3	Extraction rules, ledger matching, scam escalation
Week 4	Dialect drafts, agent screen, 50 drafts rated
Week 5	MVP: full held-out run, calibration, fraud recall, demo

github.com/drengir1/farz

If time runs short we cut extra channels first. **Never cut** the held-out set, the gate, or a person on every reply.
